

SIMATS ENGINEERING (SAVEETHA SCHOOL OF ENGINEERING)

Department of Artificial Intelligence and Data Science

ASSESSMENT TOOL 2 – Technical Presentation

Course Code:	DSA03	Course Title:	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	Assessment:	Assessment Tool 2 – Technical Presentation
Weightage:	30% of CIA		
CO1 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	M.Rishitha	Reg. No.:	192424335
Section / Batch:	2024 AIDS	Date:	16-07-2026

Code of Conduct

I M.Rishitha[192424335] (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: M.Rishitha

Instructions

- Suggested Team Member Roles (3 Members)
- Member 1: Theory, Concepts, and Literature Review
- Member 2: Algorithm Design, Models, and Technical Analysis
- Member 3: Demonstration, Case Study, Applications, and Conclusion
- GPS photo must submit.
- Duration: 30 minutes.

Section / Topic	Focus	Q Nos
Evolution of Natural Language Processing: From Rule-Based Systems to Modern NLP	NLP Models, Language Processing Evolution	TP-01
Comparative Study of NLP Models and Algorithms	Model Analysis, Algorithm Comparison	TP-02
Regular Expressions for Real-World Text Processing	Pattern Matching, Information Extraction	TP-03
Designing Efficient Regular Expression Patterns for Information Extraction	Text Mining, Data Extraction Techniques	TP-04
Finite State Automata in Natural Language Processing	State Transitions, Language Recognition	TP-05
Building a Finite State Automaton for Token Recognition	Lexical Analysis, Token Validation	TP-06
Morphology and Word Formation in Natural Languages	Morpheme Analysis, Word Structure Processing	TP-07
Inflectional Morphology: Understanding Grammatical Variations	Grammatical Analysis, Word Normalization	TP-08
Derivational Morphology and Vocabulary Expansion	Word Generation, Semantic Transformation	TP-09
Comparative Analysis of Inflectional and Derivational Morphology	Morphological Classification, Language Analysis	TP-10

Finite-State Morphological Parsing Techniques	Morphological Parsing, Finite-State Processing	TP-11
Morphological Analysis for Indian Languages	Language-Specific Morphology, NLP Challenges	TP-12
Porter Stemmer: Design, Working Mechanism, and Applications	Stemming Algorithms, Text Preprocessing	TP-13
Stemming vs Morphological Parsing: A Comparative Study	Word Reduction, Morphological Processing	TP-14
Integrated NLP Pipeline: From Regular Expressions to Morphological Processing	End-to-End Language Processing Pipeline	TP-15

Annexure A – Technical Presentation

Team No.	Technical Presentation Title	Description
1	Evolution of Natural Language Processing: From Rule-Based Systems to Modern NLP	Analyze the historical development of NLP models, key milestones, and how language processing has evolved from handcrafted rules to intelligent systems.
2	Comparative Study of NLP Models and Algorithms	Explore different NLP models and algorithms used for language processing, comparing their working principles, strengths, and limitations.
3	Regular Expressions for Real-World Text Processing	Demonstrate how regular expressions are used for data validation, text extraction, log analysis, and information retrieval in practical applications.
4	Designing Efficient Regular Expression Patterns for Information Extraction	Analyze complex regular expression patterns used to extract emails, phone numbers, URLs, dates, and structured information from unstructured text.
5	Finite State Automata in Natural Language Processing	Explain the concepts of deterministic and non-deterministic finite automata and their role in lexical analysis and language recognition.
6	Building a Finite State Automaton for Token Recognition	Design and demonstrate a finite state automaton that recognizes tokens such as identifiers, keywords, and numbers in textual data.
7	Morphology and Word Formation in Natural Languages	Investigate how words are structured and formed using morphemes, and analyze the importance of morphology in NLP systems.
8	Inflectional Morphology: Understanding Grammatical Variations	Examine how inflectional changes affect word forms based on tense, number, gender, and case across different languages.
9	Derivational Morphology and Vocabulary Expansion	Analyze derivational processes that create new words and study their impact on semantic interpretation and language understanding.
10	Comparative Analysis of Inflectional and Derivational Morphology	Compare the characteristics, applications, and challenges of inflectional and derivational morphology in NLP tasks.
11	Finite-State Morphological Parsing Techniques	Explore finite-state transducers and parsing techniques used to analyze and generate morphological structures in natural languages.
12	Morphological Analysis for Indian Languages	Study the challenges and solutions involved in performing morphological processing for morphologically rich Indian languages such as Tamil, Hindi, and Telugu.
13	Porter Stemmer: Design, Working Mechanism, and Applications	Analyze the Porter Stemming algorithm, its rule-based approach, implementation steps, and role in information retrieval systems.
14	Stemming vs Morphological Parsing: A Comparative Study	Compare stemming and morphological parsing techniques based on accuracy, computational complexity, and application scenarios.
15	Integrated NLP Pipeline: From Regular Expressions to Morphological Processing	Demonstrate a complete NLP preprocessing pipeline incorporating regular expressions, finite state automata, stemming, and morphological analysis for text processing.

Rubrics for Calculation

Technical Presentation					
Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Technical Content Accuracy	30	Highly accurate, in-depth, and insightful technical explanation	Technically correct content with adequate depth and clarity	Basic concepts presented with limited accuracy and depth	Content contains major technical errors; concepts poorly understood
Problem Identification	25	Problem rigorously analyzed using appropriate and advanced methods	Problem clearly defined with a logical engineering approach	Problem identified but analysis or methodology is weak	Problem statement unclear or incorrect; no logical approach
Use of Tools	20	Advanced tools, well-analyzed data, and highly effective visuals	Appropriate tools and data used effectively with clear visuals	Limited use of tools and basic data interpretation	Minimal or incorrect use of tools and data; poor visuals
Communication	15	Highly engaging, confident, and audience-focused delivery	Clear, organized, and professional communication	Understandable but lacks clarity, structure, or confidence	Poor organization, unclear speech, ineffective slides
Professionalism	10	Exemplary professionalism, leadership, and ethical awareness	Professional conduct with effective team collaboration	Basic professionalism; uneven team participation	Lacks professionalism; minimal contribution or ethical awareness

Team No. / Criteria Level	Technical Content Accuracy	Problem Identification	Use of Tools	Communication	Professionalism	Total %
3	23	19	20	15	10	87

NATURAL LANGUAGE PROCESSING

Models and Algorithms

From rule-based systems to statistical models, neural networks, and transformers

The Evolution of NLP Models

Four eras of language modeling, each solving the limits of the one before

1

Rule-Based

1950s–1980s

Hand-crafted grammars and regex/pattern rules written by linguists.

2

Statistical

1990s–2000s

Probabilities learned from corpora: n-grams, HMMs, Naive Bayes.

3

Neural Networks

2010s

Learned word embeddings; RNNs, LSTMs, CNNs model context.

4

Transformers

2017–present

Self-attention enables large pretrained models: BERT, GPT, T5.

Statistical Language Models

Learning probabilities directly from text corpora, before deep learning

1

N-gram Models

Estimate the probability of a word from the previous $n-1$ words (Markov assumption). Simple, fast, but suffer from data sparsity.

2

Naive Bayes Classifier

Applies Bayes' theorem with a conditional-independence assumption between features — a strong baseline for text classification and spam filtering.

3

Hidden Markov Models (HMM)

Model a sequence of observations as generated by hidden states with transition probabilities — foundational for POS tagging and speech recognition.

Sequence Labeling Algorithms

Assigning a label to every token in a sequence — e.g. part-of-speech tagging

Hidden Markov Model (HMM)

Generative

- Models joint probability $P(\text{words}, \text{tags})$
- Assumes each tag depends only on the previous tag
- Fast to train; limited use of overlapping features

Conditional Random Field (CRF)

Discriminative

- Models conditional probability $P(\text{tags} \mid \text{words})$ directly
- Freely combines overlapping, rich feature sets
- Typically outperforms HMM on tagging benchmarks

Decoding: the Viterbi algorithm finds the single most probable tag sequence in $O(n \cdot k^2)$ time using dynamic programming, for both HMMs and CRFs.

Neural Network Models

Learned representations replace hand-built features

RNN

Recurrent Neural Network

Processes tokens sequentially, passing a hidden state forward through time.

LSTM

Long Short-Term Memory

Gated RNN variant that retains context over long sequences, avoiding vanishing gradients.

GRU

Gated Recurrent Unit

A simplified, faster gated alternative to LSTM with comparable performance.

CNN

Convolutional Neural Network

Slides filters over word windows to capture local n-gram-like patterns efficiently.

Unrolled Sequence Model

Hidden state h_t carries context from h_{t-1} to h_{t+1}

GEO TAG

Transformers & Attention

Self-attention lets every token weigh every other token, in parallel

Key Takeaways

Choosing a model is a trade-off between interpretability, data needs, and accuracy

Approach	Core Idea	Examples	Best For
Statistical	Probabilities from corpus counts	N-grams, HMM, Naive Bayes	Small data, interpretability
Sequence Labeling	Structured prediction over sequences	HMM, CRF, Viterbi	Tagging, entity recognition
Neural Networks	Learned dense representations	RNN, LSTM, GRU, CNN	Medium data, sequential context
Transformers	Parallel self-attention	BERT, GPT, T5	Large data, state-of-the-art accuracy

Thank you — questions?
